

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

V. An Account of an extraordinary Effect of the Cholick: communicated to the Royal Society, by that curious Anatomist Mr. St. Andre, and read March 21. 1717.

HE Peristaltick Motion of the Intestins is by all
Anatomists suppos'd the proper Motion of those

Cylindrical Tubes.

The use of this Motion is to propel the Chyle into the vasa lasted, and to accelerate the grosser Parts of the Aliment downwards, in order to expel them, when all their nutritive Contents are extracted.

This Motion thus established, it naturally seems to follow that an inversion of it (call'd for that Reason an Antiperistaltick Motion) shou'd force the Aliments, Bile, pancreatick Juice, and lastly the Faces to ascend towards the Mouth.

The Cause of this imaginary Antivermicular Motion, is assigned to a Stoppage of the Intestin, or to a great length of it being ingaged in the same manner as the Fingers of a Glove are choak'd by inverting the Glove in drawing it off: Or like as a Silk-Stocking, which when 'tis not gartered, falls upon the Foot, and is in a manner strangled, so that some Force is required to bring it up again.

This suppos'd, the Antiperistaltick Hypothesis seems at suffice Sight very natural, and answers most Difficulties. For if the Vermicular Motion accelerates the Contents of the Intestins downwards; the Antivermicular, by the Law of Contraries, should force them upwards towards

the Mouth.

Was this Supposition as certain as 't's generally receiv'd, I shou'd not presume to advance that there is no such thing as an Antiperistaltick Motion of the Intestins; nor that the Miserere mei is oftner a violent Contraction of the Abdominal Muscles, than a Stoppage

or Inversion of the Intestins, as 'tis suppos'd.

So laying aside all Prevention, let it be granted that this Disease is a violent Contraction of the Abdominal Muscles, as I have already supposed it, caused by the Redundancy of the Intestins or their Contents. Then comparing the Symptoms of this Disease, with those of the different Kinds of Hernias, we shall find by the Analogy of the Parts, Reason and repeated Experience, that the Chordapsus, so called by Celsus, is a Disease in which the Intestins and Omentum; at other Times the Pancreas or Spleen; nay, even the Mesentery it self are forced through the Diaphragma into the Thorax.

All these tender Parts being strongly compressed, by the continual Motion of this Muscle, must by consequence cause the same Accidents as in the Bubonocele or compleat Hernia, there being no difference in these two Cases; but that the first is a strangling of the Intestin by the Diaphragm, and the latter a choaking of

the Intestins by the Abdominal Muscles.

One Example of the many of the like Nature, that I can produce, will much confirm this Assertion, and may serve to convince any Person that is impartial.

The Case is this: A Gentleman that came to Town yesterday was Sevennight in good Health, meeting with some Friends, drank a great deal of new bottled Oat-Ale, after some Pints of Wine. These Liquors fermented so violently in his Stomach and Intestins; that he was taken with a violent Cholick the same Night.

In the morning an Apothecary was sent for, who administred a Clyster, and took some Ounces of Blood

to relieve the Patient, who complain'd of a great Pain in his left Side.

The Clysters being repeated the Night following, as also the next Morning, and the Patient growing worse; the Apothecary, without Order of any Physician, gave him a violent Vomit; which operated Eight or Nine Times: This added Fewel to the Fire; and the Patient having from that Time been in a desperate Condition, two eminent Physicians were call'd, who order'd that the Clysters shou'd be repeated: But they not prevailing, I was sent for about six Hours before the Patient died: I found him complaining of a violent Pain in all the Region of the Abdomen; a frequent Inclination to vomit; having a great Difficulty of breathing, together with a very slow Pulse; his Belly being as hard as a Stone, the not swell'd.

This last Indication made me conclude, that the Discase was a violent Contraction of the Abdominal Muscles, which had overcome the Diaphragm, and that probably the Intestins might be forc'd into the Thorax.

I was the more confirm'd in this Opinion from the Examples of the like Case, which I shall shortly lay before the Society; upon which I order'd a Fomentation of hot Milk, adding to every Quart a Drachm of Liquid Laudanum, which in these Maladies gives great Relief: But before it cou'd be got ready, the Patient expir'd in a violent Convulsion.

My Opinion having been highly censur'd by the two Physicians; I open'd this Gentleman, to justific my self, or to own my Fault openly, if I had been mistaken: But as the thing happen'd as I conjectured, those Gentlemen will forgive me for taking the Liberty of justifying my self.

In opening this Body, I found the Abdominal Muscles so much contracted, that it was almost impossible to penetrate them with a very sharp Scalpel. Upon

Upon Examination, I found the Stomach empty, and fome Parts of the Duodenum, but the Jejunum and Ilium fo much distended with the fermented Oat-Ale, that the Ilium had four Inches of Diameter, and the Colon above eight.

The Ilium was also pretty much inflam'd in its inferior Part; and all the Valves of the Colon were oblite-

rated, by the great Distention of that Intestin.

But the greatest Disaster was, the Dilatation made in the Diaphragm, as I supposed; made just upon the Chink which remits the intercostal Nerve to the Viscera of the Abdomen, through which a Portion of the Colon was forced, and the greatest Part of the Omentum and Panecreas.

These tender Parts being choak'd, soon instanced, a Mortification of them following; and a Rupture of the Pancreatick Vein caus'd an internal Hamorrhage, which fill'd all the lest Cavity of the Thorax, insomuch that the whole lest lobe of the Lungs was compress'd almost under the Musculus Scalenus.

The Quantity of extravas'd Blood was very great, and it was not in the least coagulated.

I have brought the diseas'd Parts with me, to shew the Society the Certainty of this Account, and I shou'd have been more particular in proving the Impossibility of the Antiperistaltick Motion; if Doctor Hagumot had not prevented me by his Memoir.

This Gentleman is not far from Truth, and what he fays is certain: but I am surprized that the like Case

has not occurr'd in his Practice.
